

# **PREVALENCE OF DENIAL OF PREGNANCY AND ASSOCIATED FACTORS IN TURKEY**

**Nazan Aydın, MD, Prof.**

Turkish Marce Society

# GENERAL OUTLINE

1. Background
2. Objective and Hypothesis
3. Subjects and Methods
9. Results
11. Conclusion

# BACKGROUND

## Pregnancy Denial

**Lack of awareness of *being pregnant*  
during the first 20 weeks or more of gestation**

# BACKGROUND

## Other Clinical Features

- Minor or no changes in body weight and waist size
- No perception of fetus movements
- No or minor pregnancy symptoms
- In some instances, periods are normal

## Consequences

### Inadequate prenatal care

- poor nutrition
- fetal abuse
- unattended or precipitous delivery

### Neonatal risks

- prematurity
- low birth weight
- small for gestational age

(Neifert and Bourgois, 2000)

# BACKGROUND

## Overall Estimated Prevalence

- 1 in 475 pregnancies (211/100 K) (2.11‰)
- Full denial 1/2500 (40/100 K) (0.40‰)

(Wessel and Buscher, 2002)

## **HYPOTHESIS:**

Contrary to popular belief, women who fail to recognize their pregnancy before delivery are not lying or are not mostly severely psychotic

## **OBJECTIVE:**

Determine 1 year prevalence of denial of pregnancy and risk factors in Erzurum province

# SUBJECTS AND METHODS

## Duration

January 1, 2013 - January 1, 2014

## Setting

All institutions with deliveries were included

## Tools

Socio-demographic data form

The Structured Clinical Interview for DSM-IV (SCID-I)

Control Data (Aksoy<sup>\*</sup> et al. *The relationship between fear of childbirth and women's knowledge about painless childbirth. Obstetrics and Gynecology International*, March, 2014).

# RESULTS

## Prevalance of Pregnancy Denial

➤ 30/15792

➤ 1 in 526 pregnancies (1.9 ‰)

## Socio-demographic Features

### Ages of Mothers

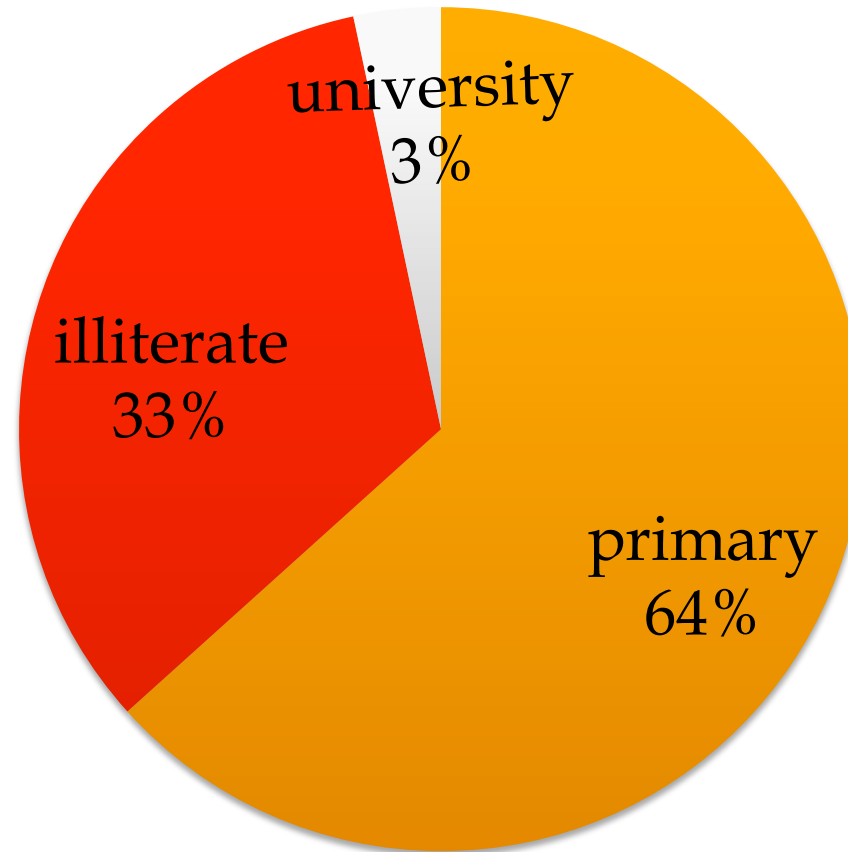

## Socio-demographic Features

| Marital status | Single | Married |
|----------------|--------|---------|
|                | 2      | 28      |

## Socio-demographic Features

### Education Level

## Socio-demographic Features

# RESULTS

| Awareness<br>Time (weeks) | Number of cases |
|---------------------------|-----------------|
| 20                        | 17              |
| 21                        | 1               |
| 24                        | 6               |
| 26                        | 1               |
| 28                        | 1               |
| 34                        | 1               |
| 35                        | 1               |
| 37                        | 1               |
| 40                        | 1               |

# RESULTS

## Socio-demographic Features

### History of irregular menses

## explanations for amenorrhea

Half of women reported that they have had amenorrhea during gestation; others reported some bleeding in that time.

## Birth Weights of Newborns

## Birth Related Features

| Breastfeeding status | Yes | No |
|----------------------|-----|----|
|                      | 18  | 12 |

## RESULTS

| SCID Diagnosis          | Number of cases |
|-------------------------|-----------------|
| Anxiety Disorder        | 5               |
| Somatoform disorder     | 2               |
| Mild Mental Retardation | 1               |
| None                    | 22              |

Nine of them have had been diagnosed with a psychiatric disorder in the past (most of them were depression)

## Results

|                | <b>Group</b> | <b>N</b> | <b>Mean</b> | <b>Std. Deviation</b> | <b>P value</b> |
|----------------|--------------|----------|-------------|-----------------------|----------------|
| Age            | Control      | 165      | 29,2121     | 4,23802               | <b>0.012</b>   |
|                | Study        | 30       | 31,7000     | 7,80870               |                |
| BMI            | Control      | 165      | 29,0691     | 3,18511               | <b>0.000</b>   |
|                | Study        | 30       | 26,1667     | 3,94866               |                |
| Parity         | Control      | 165      | 2,6424      | 1,12049               | <b>0.020</b>   |
|                | Study        | 30       | 3,3667      | 1,51960               |                |
| Gestation Week | Control      | 165      | 38,9194     | 1,17717               | <b>0.000</b>   |
|                | Study        | 30       | 37,8667     | 1,61316               |                |
| Baby Weight    | Control      | 165      | 3519,2424   | 383,89913             | <b>0.000</b>   |
|                | Study        | 30       | 2879,6667   | 436,25549             |                |

# CONCLUSION

- ✓ Pregnancy denial is not rare as supposed
- ✓ Most of them are not psychotic or concealing
- ✓ Occurrence of denied pregnancy seems yet to be similar across different socio-demographic conditions.
- ✓ This prospective, population-based study has also certain epidemiological relevance. The common view that denied pregnancies are exotic and rare events is no longer valid.
- ✓ More studies of similar design are needed.
